

The most basic L^AT_EX document simply contains a documentclass command to indicate that an article is being created, then a begin document command to start the body of the document. Inside the body goes the markup. Each paragraph is separated by a newline, and is automatically indented. The L^AT_EX language supports commands for:

- **bold**,
- *emphasis*,
- **teletype**,

and other font attributes. With regex substitutions, it's very easy to change things such as font attributes throughout the document. Here are some built-in documentclasses:

1. report
2. article
3. slides
4. book
5. letter
